Solución exacta: u(x,y) = 400xy por lo que la aproximación en diferencias finitas no tiene error:

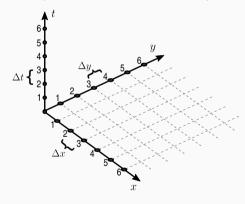

$$\frac{\partial^4 u}{\partial x^4} = \frac{\partial^4 u}{\partial y^4} = 0$$

$$\frac{\partial u}{\partial t} = \alpha \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right)$$

(más condiciones de borde/inicial)

$$\frac{\partial u}{\partial t} = \alpha \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right)$$

(más condiciones de borde/inicial)

$$\frac{\partial u}{\partial t} = \alpha \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right)$$

(más condiciones de borde/inicial)

Grilla:

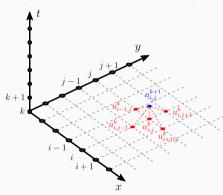

$$x_i = i\Delta x, \ y_j = j\Delta y, \ t_k = k\Delta t, \ u(x, y, t) = u_{i,j}^k$$

Diferencias finitas (hacia adelante - explícito):

$$\begin{split} \frac{u_{i,j}^{k+1} - u_{i,j}^k}{\Delta t} &= \alpha \left(\frac{u_{i+1,j}^k - 2u_{i,j}^k + u_{i-1,j}^k}{\Delta x^2} \right. \\ &+ \left. \frac{u_{i,j+1}^k - 2u_{i,j}^k + u_{i,j-1}^k}{\Delta y^2} \right) \end{split}$$

 $\frac{\partial^2 u}{\partial x^2}(x_i, t_j) - \alpha^2 \frac{\partial^2 u}{\partial x^2}(x_i, t_j) = 0$

Ignorando $\epsilon_{i,j}$ y haciendo $\lambda = \alpha k/h$ (número de Courant):

$$u_{i,j+1} - 2u_{i,j} + u_{i,j-1} - \lambda^2 u_{i+1,j} + 2\lambda^2 u_{i,j} - \lambda^2 u_{i-1,j} = 0$$

Resolviendo para el paso temporal:

$$u_{i,j+1} = 2(1 - \lambda^2)u_{i,j} + \lambda^2(u_{i+1,j} + u_{i-1,j}) - u_{i,j-1}$$

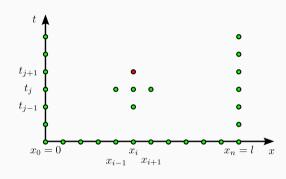

para $i=1,2,\ldots,n-1$ y $j=1,2,\ldots$

Las condiciones de frontera resultan:

$$u_{0,j} = u_{n,j} = 0, j = 1, 2, \dots$$

y la condición inicial:

$$u_{i,0} = f(x_i), i = 1, 2, \dots, n-1$$

Enfoque matricial:

$$u^{(j+1)} = Au^{(j)} - u^{(j-1)}$$

Ecuación en diferencias:

$$f''(x_i) = \frac{f(x_{i+1}) - 2f(x_i) + f(x_{i-1})}{h^2} - \frac{h^2}{12}f^{(4)}(\xi_i)$$

$$u(x_i, t_1) = (1 - \lambda^2) f(x_i) + \frac{\lambda^2}{2} f(x_{i+1}) + \frac{\lambda^2}{2} f(x_{i-1}) + kg(x_i) + \mathcal{O}(k^3 + h^2 k^2)$$

$$u_{i,1} = (1 - \lambda^2)f(x_i) + \frac{\lambda^2}{2}f(x_{i+1}) + \frac{\lambda^2}{2}f(x_{i-1}) + kg(x_i)$$
