 para cada $j = 0, 1, \cdots, n$

$$E = \int_{a}^{b} [f(x)]^{2} dx - 2 \sum_{k=0}^{n} a_{k} \int_{a}^{b} x^{k} f(x) dx + \int_{a}^{b} \left(\sum_{k=0}^{n} a_{k} x^{k} \right)^{2} dx$$

$$\frac{\partial E}{\partial a_j} = -2 \int_a^b x^j f(x) dx + 2 \sum_{k=0}^n a_k \int_a^b x^{j+k} dx$$

Ecuaciones normales lineales (n + 1):

$$P_n(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0 = \sum_{k=0}^n a_k x^k$$

$$E \equiv E_2(a_0, a_1, \dots, a_n) = \int_a^b \left(f(x) - \sum_{k=0}^n a_k x^k \right)^2 dx$$

$$\sum_{k=0}^n a_k \int_a^b x^{j+k} \, dx = \int_a^b x^j f(x) \, dx$$
 para cada $j=0,1,\cdots,n$

Ejemplo: aproximar $f(x) = \sin \pi x$ por un polinomio de grado 2 en [0,1]. Ecuaciones normales:

$$a_0 \int_0^1 1 \, dx + a_1 \int_0^1 x \, dx + a_2 \int_0^1 x^2 \, dx = \int_0^1 \sin \pi x \, dx$$

$$a_0 \int_0^1 x \, dx + a_1 \int_0^1 x^2 \, dx + a_2 \int_0^1 x^3 \, dx = \int_0^1 x \sin \pi x \, dx$$

$$a_0 \int_0^1 x^2 \, dx + a_1 \int_0^1 x^3 \, dx + a_2 \int_0^1 x^4 \, dx = \int_0^1 x^2 \sin \pi x \, dx$$

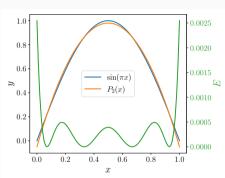

$$a_0 + \frac{1}{2}a_1 + \frac{1}{3}a_2 = \frac{2}{\pi}$$

$$\frac{1}{2}a_0 + \frac{1}{3}a_1 + \frac{1}{4}a_2 = \frac{1}{\pi}$$

$$\frac{1}{3}a_0 + \frac{1}{4}a_1 + \frac{1}{5}a_2 = \frac{\pi^2 - 4}{\pi^3}$$

$$a_0 = \frac{12\pi^2 - 120}{\pi^3} \approx -0.050465$$

$$a_1 = -a2 = \frac{720 - 60\pi^2}{\pi^3} \approx 4.12251$$

Si para cada $j=0,1,\cdots,n$, $\phi_j(x)$ es un polinomio de grado j, entonces el conjunto $\{\phi_0,\cdots,\phi_n\}$ es LI en cualquier intervalo [a,b].

Ejemplo. Si $\phi_0(x)=2, \phi_1(x)=x-3, \phi_2(x)=x^2+2x+7$ y $Q(x)=a_0+a_1x+a_2x^2$, mostrar que existen constantes c_0, c_1, c_2 tales que $Q(x)=c_0\phi_0(x)+c_1\phi_1(x)+c_2\phi_2(x)$.

$$= \phi_2(x) - 2\phi_1(x) - \frac{13}{2}\phi_0(x)$$

Ortogonalidad de polinomios de Chebyshev

$$\int_{-1}^{1} \frac{T_n(x)T_m(x)}{\sqrt{1-x}} dx = \int_{-1}^{1} \frac{\cos(n \arccos x) \cos(m \arccos x)}{\sqrt{1-x^2}} dx$$

Reintroducimos $\theta = \arccos x$:

$$d\theta = -\frac{1}{\sqrt{1-x^2}}dx$$

$$\int_{-1}^{1} \frac{T_n(x)T_m(x)}{\sqrt{1-x^2}}dx = -\int_{\pi}^{0} \cos(n\theta)\cos(m\theta) d\theta$$

$$= \int_{0}^{\pi} \cos(n\theta)\cos(m\theta) d\theta$$

Para $n \neq m$:

$$\cos(n\theta)\cos(m\theta) = \frac{1}{2}[\cos(n+m)\theta + \cos(n-m)\theta]$$

Entonces:

$$\langle T_n, T_m \rangle_w = \frac{1}{2} \int_0^\pi \cos[(n+m)\theta] d\theta$$

$$+ \frac{1}{2} \int_0^\pi \cos[(n-m)\theta] d\theta$$

$$= \left[\frac{\sin[(n+m)\theta]}{2(n+m)} + \frac{\sin[(n-m)\theta]}{2(n-m)} \right]_0^\pi$$

$$= 0$$

y

$$\langle T_n, T_n \rangle_w = \begin{cases} \frac{\pi}{2}, & n \ge 1\\ \pi, & n = 0 \end{cases}$$
